

Development Summary

Location Management

- Provinces: Create, Update, Get All, Get by ID, Delete
 - Cities: Create, Update, Get All, Get by ID, Delete
 - Areas: Create, Update, Get All, Get by ID, Delete
-

Categories

- Parent & Child Categories: Full backend for Create, Edit, View by ID, Get All, and Delete
 - Localized Categories: Built support for region/language-based category system
 - Localized Subcategories: Each child category can now be localized per region or language
 - Designed to be compatible with multilingual frontends or region-specific setups
-

Tags & Attributes

- Tags: Fully manageable backend for content tags and business style tags
 - Filters: Backend setup to create and manage custom filters
 - Attributes: Dynamic structure to add/edit attribute types across different modules
-

Local Scene

- Admin can create and manage local scenes
 - API is ready for frontend (client side) to display or interact with local scenes
-

Custom Pages

- Ability to create and manage custom/static pages from the backend
 - Can be used for content like About Us, Privacy Policy, etc.
-

Operator Profiles

- Business Board Sign-up integrated
 - Support for creating and managing different types of operator profiles:
 - Individual
 - Company
 - Delivery Agent
 - Brand
 - Address module: APIs to create, update, view, and delete operator addresses
-

Authentication & Role Management

- JWT-based secure authentication
 - Role-based access control implemented — only admins can access/administer sensitive routes
-

File Upload System

- Universal API created for uploading files to AWS S3
 - Works with all modules that require file/image uploads (e.g., profiles, local scenes, etc.)
 - Returns secure file URLs after upload
-

Codebase Migration

- Entire backend migrated from older JavaScript + Sequelize setup
- Now running on modern TypeScript + Prisma (clean, typed, and efficient)
- Database models have been rebuilt with proper structure and relationships
- Clean folder structure and service-based architecture for easier development

- Proper validation, error handling, and modularity introduced for future scalability
-

CI/CD Deployment Pipelines

All core systems now support automatic deployment using **GitHub Actions**, **PM2**, and **AWS Lightsail**. No manual steps required for builds or restarts.

Deployment Pipelines are set up for:

- Backend API
- Business Board
- User Panel
- Guest Flow
- Admin Panel

Each environment includes:

- Auto-pull latest code from GitHub (Dev & Staging branches)
- Install all required dependencies
- Build the project
- Restart using PM2 for process management
- Reload Nginx safely after changes
